DETAILED ACTION

Allowable Subject Matter

1. Claim 2-16 and 18-28 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1 and 17 rejected under 35 U.S.C. 103(a) as being unpatentable over Reber (6,393,070) in view of Connel et al. (5,977,840)

Regarding Claims 1 and 17, Reber discloses a digital communication device and a mixer where in Fig. 4 and column 5 lines 4-10, a switched capacitor circuit comprising a first positive switch element 47A for selectively connecting the first positive side first node to a second node according to a first control signal C where the first positive side is connected to a positive side capacitor 51A and a precharge circuit 46A connected to the first positive side node for precharging the first positive side node to a precharge voltage for a predetermined time which is seen as the time when switch 46A is closed when the switch capacitor circuit is switched off. Reber fails to disclose the required switching structure with relationship to the capacitor and precharge circuitry. However, Connell et

al. disclose a circuit for minimizing turn-on time of temperature compensated crystal oscillator where in Figs. 2 and 3, the required switch S is disclose with relationship to the capacitor C1 and the precharge circuitry 24.

It would have been obvious to one of having ordinary skill in the art at the time the invention was made to include the required relationship between switch and capacitor and precharge circuitry in Reber as taught by Connel et al in order to have a semiconductor device with increased performance.
